DIDE | Windows User Guide

Document Intelligence & Data Extraction Agent | Beta release v2.0.0

A practical walkthrough for processing files, checking OCR results, and exporting approved Excel data. This guide describes the existing desktop workflow, not a demonstration of a completed installation.

1. Install and open DIDE

Download the installer from the DIDE download portal. Run the Windows setup executable, follow the prompts, and open DIDE from the Start menu. Confirm OCR works with a sample image before processing important records. Some builds may require Tesseract OCR installed or bundled.

2. Add files

Click **Add documents**. Select images, PDF, TXT, DOCX, or PPTX files. The **Document Queue** shows the selected files, progress and state. For several files, DIDE processes a batch and presents records in upload order.

3. Correct orientation and inspect the preview

Select an image in the queue. If the picture is sideways, use **Rotate left** or **Rotate right** before extracting. DIDE makes a backup of the original raster image before rotation. Use **Fit page / width** and **Enlarge / zoom / pan image** to read small print; select queue rows to inspect the corresponding file. Rotation does not currently apply to PDF/DOCX/PPTX pages.

4. Run extraction

Click **Start extraction**. Monitor file status, progress, stage and the activity/error log. During processing, the preview follows the current image or PDF page. **Pause** and **Resume** affect queued work; cancellation is cooperative and may not stop an OCR operation already running. Use **Retry failed** if necessary. CPU/RAM and ETA are approximate indicators.

5. Review and correct data

In **Extracted Data**, DIDE presents a single cumulative review worksheet. Each source image/file has its own row and relevant nonempty dynamic columns. Double-click a cell to correct a name, amount, phone number, or other field. Uncertain OCR fragments may require manual correction: do not treat blank or review-required fields as verified. Use **+ Row** or **- Row** for manual row management.

6. Process more images

Select **New batch / reset queue** to clear the current queue while keeping extracted rows in the open session. Then add another image and start extraction again. Previously reviewed data remains in memory during the

same session; export it before closing DIDE. Multiple pages about one franchise can still appear as separate image rows in the v2.0 build.

7. Approve and export Excel

After inspecting and fixing the table, click **Approve reviewed data**, then **Export approved Excel**. Choose an XLSX filename. To append to an existing workbook, select that same file in the save dialog. DIDE makes a backup and skips exact duplicate rows, but changed records may create additional versions. Close the workbook in Excel first to avoid Windows file-lock errors. Editing after approval requires approving again.

8. Troubleshooting

• **Missing values:** Zoom in and check whether the document is legible. Rotate the source image, rerun OCR and edit unrecognized fields manually.

• **Wrong or duplicate fields:** Verify labels and amounts against the source image. No guaranteed semantic AI accuracy is claimed for complex brochures.

• **Excel Access denied:** Close the workbook in Excel and retry; choose a writable location.

• **Preview differs from source:** Re-select the queue file when processing is inactive. If a document type cannot render visually, use extracted text and source file for verification.

• **Privacy:** Documents and extracted fields can contain sensitive information. Protect local output files and checkpoints.

9. Beta limitations and support

DIDE uses OCR and rule-based field mapping. Photographs, multi-column brochures, monetary figures and contact fields can be inaccurate or incomplete. Validate all business-critical data before use. For issues, report the Windows version, DIDE build, file type and a redacted screenshot at GitHub Issues. Do not upload confidential source documents publicly.
